

# Does It Mix? Experiment Instructions

### Objective:

Test different solids and liquids to observe how they interact with water—both at room temperature and when the water is heated.

#### **Materials:**

- 2 clear cups or containers (for each material)
- Room temperature water
- Hot water (handled safely by an adult)
- Measuring spoons
- Stirring sticks or plastic spoons
- Solids: salt, sugar, flour, rice, baking soda
- Liquid: cooking oil
- "Does It Mix?" Data Chart
- Pencil

#### **Procedure:**

- 1. Prepare your testing station. Label two cups for each material: one for room temperature water, one for hot water.
- 2. Add water. Fill one cup with room temp water. Have your teacher add hot water to the other cup.
- 3. Test the first material (e.g., salt). Add 1 spoonful to the room temp cup. Stir. Observe. Repeat in the hot water cup.
- 4. Record your observations using your data chart.
- 5. Repeat for each material: sugar, flour, rice, baking soda, and oil.

## What to Look For:

- Does it dissolve?
- Does it float or sink?
- Any difference between hot and cold water?
- Does it stay the same or change?

## **Safety Reminders:**

- Only adults should handle hot water.
- Don't taste or touch the materials.
- Clean up your area when finished.
